CPO Washing for mitigation of 3-MCPDE

3-MCPD has been getting a lot of attention in recent years in the edible oil industry. In fact, discussion about it has been around for decades.

In 1978, 3-MCPD and its esters were identified as food contaminants in hydrolyzed vegetable proteins (HVPs.)

Since then, efforts have been made to identify in other foods, including edible oils, that may contain these contaminants.

CPO Washing for mitigation of 3-MCPDE

In 2013, the European Food Safety Authority (EFSA) identified margarine, preserved meats, bread and vegetable oil as major sources of 3-MCPD and its esters.

Extensive studies about the potentially harmful effects of this trace compounds in the human body led to increased regulation in 2018 about the maximum content of these contaminants in food.

As such, it is important to understand what 3-MCPDE is, and how to reduce its formation in edible oil refining.

Official Journal of the European Union

24.9.2020

COMMISSION REGULATION (EU) 2020/1322

of 23 September 2020

amending Regulation (EC) No 1881/2006 as regards maximum levels of 3-monochloropropanediol (3-MCPD), 3-MCPD fatty acid esters and glycidyl fatty acid esters in certain foods

(Text with EEA relevance)

CPO Washing for mitigation of 3-MCPDE

'Section 4: 3-monochloropropanediol (3-MCPD), 3-MCPD fatty acid esters and glycidyl fatty acid esters

| | Foodstuffs (†) | Maximum level (µg/kg) |
|--------|---|-----------------------|
| 4.3 | Sum of 3-monochloropropanediol (3-MCPD) and 3-MCPD fatty acid esters, expressed as 3-MCPD (****) | |
| 4.3.1. | Vegetable oils and fats, fish oils and oils from other marine organisms placed on the market for the final consumer or for use as an ingredient in food falling within the following categories, with the exception of the foods referred to in 4.3.2 and of virgin olive oils (*): — oils and fats from coconut, maize, rapeseed, sunflower, soybean, palm kernel and olive oils (composed of refined olive oil and virgin olive oil) (*) and mixtures of oils and fats with oils and fats only from this category, | 1 250 |
| | — other vegetable oils (including pomace olive oils (*)), fish oils and oils from other marine organisms and mixtures of oils and fats with oils and fats only from this category, - Including refined Palm Oil | 2 500 |
| | — mixtures of oils and fats from the two abovementioned categories. | — (*****) |

CPO Washing for mitigation of 3-MCPDE

HAS ADOPTED THIS REGULATION:

Article 1

The Annex to Regulation (EC) No 1881/2006 is amended in accordance with the Annex to this Regulation.

Article 2

Fish oils and oils from other marine organisms referred to in point 4.2.1 and 4.2.2 of the Annex to Regulation (EC) No 1881/2006 and young child formula referred to in point 4.2.3 and 4.2.4 of that Annex that were lawfully placed on the market before 1 January 2021 may continue to be marketed until 30 June 2021.

Foodstuffs listed under point 4.3 of the Annex to Regulation (EC) No 1881/2006 that were lawfully placed on the market before 1 January 2021 may continue to be marketed until their date of minimum durability or use-by date.

CPO Washing for mitigation of 3-MCPDE

3-MCPDE found present in Refined Palm Oil is not found in Crude Palm Oil.

But the contaminant that is the pre-cursor to the formation of 3-MCPDE, which is Chloride are found in Crude Palm Oil.

To mitigate the formation of 3-MCPDE, this contaminant must be reduced or removed from the Crude Palm Oil before refining.

CPO Washing for mitigation of 3-MCPDE

Studies carried out on animals showed that fatty acid esters of 3-MCPD and free 3-MCPD affects kidney and male reproductive systems.

International Agency for Research on Cancer of World Health Organization has classified 3-MCPD as Group 2B, “possible carcinogenic to humans”.

CPO Washing for mitigation of 3-MCPDE

3MCPDE is formed in heat-processed fatty foods from glycerol or acyl glycerides in the presence of chloride ions. The formation of 3MCPDE is an irreversible process. Once formed, there is no known method by which it can be removed.
